The monograph chapter on weather forecasting and numerical weather prediction describes the history of weather observations used for preparing forecasts during the past years Benjamin et al. These appendices are useful for finding measurement parameters, numbers of sites, operating agencies, and locations where the data can be obtained.

Signal-processing technology was advancing rapidly and research groups and television stations were early adopters of the color displays and Doppler technology.

Subsequent refinements in sonicanemometers, along with other instruments
Legal notices. Geostationary satellites are, in essence, motionless above a point on the equator, usually referred to as the subsatellite point. Consequently, most of the early advances in radar meteorology appeared in these proceedings a few years prior to if at all in any journal publication.

Despite a number of improvements, bright areas show where the satellite sensor of radar is shown in this chapter.
